

FOR IMMEDIATE RELEASE

February 7, 2007 - Scotts Valley, CA

Today SpinSite[™] Incorporated, a recognized leader in the online website development market, announced the general availability of SpinSite Enterprise Server[™], a revolutionary feature-rich content and intranet management system for use within corporate firewalls.

SpinSite Enterprise Server is a fully-functional ready to use content management solution for creating and managing departmental and project-related websites inside corporate firewalls. SpinSite Enterprise Server comes pre-installed on your choice of a rack-mount or desktop server. Just add the server behind your corporate firewall and assign an IP address. SpinSite Enterprise Server is ready for content within minutes.

The Natural Complement

Perfect for use either as a stand-alone intranet solution, or as a natural complement to an existing CMS portal, SpinSite Enterprise Server gives company employees easy browser-based access to needed company information from any PC. Typical internal websites include Human Resources, Payroll, Marketing, Shipping & Receiving, Development, Project Websites, Scheduling, Sales, or even an Employee Store. There is no limit to the number of departmental websites, or to the amount of content or features, that can be added.

According to Ed Hoskins, CEO of SpinSite Inc, SpinSite Enterprise Server is designed not only for end-user content development and management, but also for overall IT departmental control. Webpages are created and maintained by a designated individual within each department, rather than by the IT Department itself. Intuitive, built-in tools make it easy for authorized individuals to create and maintain websites in minutes, and employees can quickly access these websites to search for information or files. SpinSite Enterprise Server is the easiest and fastest way to connect you and your employees.

Ready in Minutes, Live in Hours

Unlike standard development tools, which require a substantial investment of money and manpower before they are ready for use, SpinSite Enterprise Server is completely developed, comes pre-installed on its own dedicated server, and is immediately ready for content addition. Prior to delivery, SpinSite Enterprise Server can even be customized to emulate the look and feel of your established corporate presence. After customization, all internal websites and webpages will automatically inherit this custom framework from the Enterprise Server, ensuring that your company intranet will look consistent throughout your corporation.

The creation and editing of pages is completely intuitive to those familiar with any common word processing program. Online help and fourteen (14) online "how-to" videos made using Adobe® Flash[™] technology guide first-time users step-by-step through the process of creating webpages by demonstrating each aspect of adding text, photos, PDF documents, video clips, data collection tables, photo albums, calendars, and even blogs to a departmental website.

Instant Accessibility, Flexibility, and Total Control

Although each website allows multiple users to view the website simultaneously, only the department administrator for that particular website can make changes, or grant an individual user the right to modify the entire website or only certain designated pages within the website. Pages may be hidden from public view and designated viewable only by a specified individual or individuals. Also, department and project-related websites

may be hidden entirely, so that only authorized visitors may login to view the content.

When SpinSite Enterprise Server is used as an enhancement to an existing corporate portal simple links added to the existing system provide one-click access to any part of the new intranet. Websites can easily be blocked, deleted, or given limited access by the IT department. Detailed change logs store activities for each website, including the date and time of each change, and the authorized user that is making each change. For a complete description of SpinSite Enterprise Server, please visit us online at www.spinsite-enterprise.com.

No other Intranet solution provides such consistency and control of inner-departmental information sharing, while still giving the IT department complete administrative control over the entire network of departmental websites. SpinSite Enterprise Server is attractively priced at only \$5,995. The SpinSite Enterprise Server licensing plan is very simple, comprised of an up-front startup fee and an annual licensing fee thereafter. Annual support includes standard feature and product upgrades as they become available. Annual support fees are based on the number of employees with access to the intranet websites, usually all company employees.
